

McDonald's Australia — Demo Brief

Monday 25 May · 10:30am · Thornleigh · In person

~1,200 restaurants
~10 yrs on Donesafe
130k employees

The opportunity

McDonald's is running a genuine RFP — first time they've gone to market in close to 10 years. They're frustrated with Donesafe, not just doing a procurement exercise. The safety team processes roughly 9,000 hazards and incidents a month across ~1,200 restaurants. Paul leads both safety and insurance. Cathy manages all platform config in-house. Around 20 people in the room and online on Monday — safety, ops, customer service, food safety, employee relations and IT.

What's driving the review

- **Data locked behind Power BI.** Cathy manually exports to Excel to build severity trend reports. Licensees can't see their own data. Ops consultants can't get insights on the road. This is the number one demo moment.
- **No real mobile app.** Restaurants are pinning a browser to an iPad. Donesafe promised a purpose-built app for 8–12 months. Still not there. Managers need to capture fast and get back to the floor.
- **Systems don't talk to each other.** They have a live API from Donesafe into Solve (workers comp). Training and HR are disconnected. They want automations and smart fields instead of free text.

In their own words

Paul — data

"The data accessibility... the ops team and even us as a safety team would love that coming out of the platform it's actually been derived from — not going through Power BI. Having it readily digestible — actionable insights, trends, some smarts around that. That's been a real sore point."

Paul — mobile

"We need the app that's purpose built to be on a phone or an iPad. Ops consultants are doing everything on their phone on the road. They don't have the time or flexibility to jump on a desktop."

Paul — Donesafe

"We're getting promised this for 8–12 months. When's the tyres gonna hit the road."

Kathy — mobile

"Currently the restaurants pin the browser to their phone or their iPads. It's not actually an app that they're using."

Kathy — reporting

"I currently do a lot of manually Excel creations off that just because we want to be able to see it. From a licensee point of view — widgets, pies, graphs — easily be able to go, okay, I've had 10 high severity security incidents."

Where we stand

Requirement	Status	Notes
Mobile app (iOS + Android)	✓ Yes	Native SC app. Works on iPhone and iPad. Open it in the room.
Incident capture	✓ Yes	Smart fields, dropdowns, photo capture, auto-routing.
Investigations	Basic function	Managing multiple teams with only 1 investigations board and terminology
Native analytics	✓ Yes	Trend reporting with persona-based permissions. No Power BI needed.
5-star severity rating	Roadmap	Shipping in 6 months. Benchmarking Issues will be valuable
AI Issue Capture	Early Access	Photo or voice note → AI pre-fills incident fields. Directly solves the free text problem. QR-code flow live now, native mobile coming. Mention on the roadmap slide.
AI Vision (inspection completion)	Field Testing	Photos during inspection → AI pre-fills checklist answers. 89% accuracy in testing. Don't demo — mention as direction of travel on the AI slide.
Analytics on investigations	Roadmap	Not native yet. Power BI bridges this in the interim.
Solve API (workers comp)	✓ Yes	Need to confirm before Monday. Potential blocker if we can't replicate.
Native workflow automation	✗ Gap	No native workflow logic. Atturra can build and manage this layer with Workato
Risk register	✗ Gap	Donesafe has a dedicated module. SC doesn't. Will come up in the room.

Where Atturra fills the gap

We won the AusPost RFP with the same playbook — SC as the platform, Atturra as the delivery and integration partner. The gaps above aren't necessarily deal-breakers if we position it right.

- **Solve API integration.** Atturra can build and manage the API connection from SC into Solve, replicating what they have today with Donesafe. Same outcome, different pipe.
- **Workflow automation.** Where SC doesn't have native workflow logic, Atturra can build custom workflows on top of SC's API layer. This is exactly what they did for AusPost's Workato automations.
- **Risk register.** Atturra can build a risk register view in Power BI or as a custom SC integration while the native product catches up. Not ideal but buys time.
- **Data migration.** Close to 10 years of Donesafe data. Atturra project-manages a phased pilot — start with a handful of McOpCo restaurants, migrate in stages, run Power BI in parallel for YoY history until SC analytics can carry it natively.

The pitch: "SC is the platform. Atturra makes it work for McDonald's specifically. You're not buying a product off a shelf — you're getting a configured solution."

Demo flow

Paul told us what he wanted to see. Two scenarios. Keep it tight.

- Scenario 1 — Slip and fall. Restaurant manager, iPhone, fast mobile capture. Smart dropdowns, auto-routing, corrective actions generated. Under 90 seconds.
- Scenario 2 — Customer aggression. Ops consultant picks it up on mobile, reviews, attaches CCTV, assigns actions, closes the investigation. Show different department views — safety, employee relations, QA.
- Reporting — Show native analytics. Severity trend by restaurant and state. Licensee view vs ops consultant view vs safety team view. Ask Cathy: does this replace what you're building in Excel?
- Roadmap — One slide. Investigations, analytics permissions, 5-star severity. Frame as 'here's what you'll have by go-live.'
- Vision — One slide each on insurance (Craveable, GYG) and sensors (Craveable, Cheesecake Factory). Plant seeds, don't pitch.
 - AI Issue Capture — This lands directly on Paul and Kathy's free text problem. The restaurant manager snaps a photo or records a voice note — AI pre-fills the incident fields before submission. Faster, more consistent, less cognitive load on the floor. Currently in Closed Early Access via QR code, with native mobile app support on the roadmap. Frame it as "this is what incident reporting looks like in 12 months."
 - AI Vision (inspection completion) — Still in field testing but worth planting. A crew member takes photos during a kitchen or cleaning inspection and AI pre-fills checklist answers in real time — 89% answer accuracy in internal testing. Human review still required before submission. For McDonald's with 9,000 incidents and hazards a month, the efficiency story is significant. Don't demo it — mention it as part of the AI roadmap slide to show direction of travel.

Actions before Friday morning 22nd

- Team assembled, roles assigned and approach
- Demo environment configured for two personas on iPhone/iPad — restaurant manager and ops consultant
- Atturra briefed and ready to speak to integration and migration approach
- Roadmap slide with approximate timelines for investigations, analytics and 5-star severity
